## AMENDMENTS TO THE CLAIMS

Amend the claims as follows. This listing of claims will replace all prior versions, and listings, of claims in the application.

## **Listing of Claims**

- 1. (Currently amended) A method to operate a digital signal receiver, comprising:
  - detecting the occurrence of a symbol degrading event for a received signal, wherein the symbol degrading event occurs after transmission and before reception of the received signal;
  - determining which symbols have been degraded by the symbol degrading event; inserting zero symbols into a received symbol stream to replace symbols that have been determined to have been degraded by the signal degrading event prior to de-interleaving the received signal; and
  - error correction decoding the received symbol stream having the inserted zero symbols.
- 2. (Original) A method as in claim 1, where error correction decoding comprises operating a Reed-Solomon decoder.

Commissioner for Patents Application Serial No. 10/820,347 May 28, 2009 Page 3

- 3. (Original) A method as in claim 1, where error correction decoding comprises operating a BCH decoder.
- 4. (Original) A method as in claim 1, where error correction decoding comprises operating a Turbo decoder.
- 5. (Original) A method as in claim 1, where inserting occurs in conjunction with operating a BPSK bit metric calculator.
- 6. (Original) A method as in claim 1, where inserting occurs after a Viterbi decoder.
- 7. (Original) A method as in claim 1, where error correction decoding comprises first de-interleaving the received symbol stream having the inserted zero symbols.
- 8. (Previously presented) A method as in claim 1, where detecting comprises:

estimating a signal to noise ratio (SNR) of a block of L contiguous received symbols, where L is an integer greater than or equal to one; comparing the estimated SNR to a threshold SNR value; and

Page 4

replacing L symbols with L zero symbols when the estimated SNR is less than the

threshold SNR.

9. (Original) A method as in claim 1, where detecting comprises examining

the output of at least one Automatic Gain Control (AGC) circuit.

10. (Original) A method as in claim 9, where detecting comprises comparing

the output of a slow AGC to a first threshold, comparing the output of a fast AGC to a

second threshold, and replacing symbols with zero symbols when either the first or the

second threshold is exceeded.

11. (Original) A method as in claim 9, where detecting comprises comparing a

difference between the output of a slow AGC and the output of a fast AGC to a threshold,

and replacing symbols with zero symbols when the difference exceeds the threshold.

12. (Original) A method as in claim 9, where detecting comprises comparing a

difference between the output of a fast AGC and an average of the output of the fast AGC

to a threshold, and replacing symbols with zero symbols when the difference exceeds the

threshold.

13. (Original) A method as in claim 1, where detecting uses information

received from a transmitter that is indicative of a time when a deep fade occurs.

14. (Currently amended) A digital signal receiver, comprising:

circuitry for detecting the occurrence of a symbol degrading event for a received signal; for determining which symbols comprising the signal have been degraded by the symbol degrading event; and for inserting zero symbols into a received symbol stream to replace symbols that have been determined to have been degraded by the symbol degrading event prior to de-interleaving the received signal, wherein the symbol degrading event occurs after transmission and before reception of the received signal; and a decoder for decoding the received symbol stream having the inserted zero

- a decoder for decoding the received symbol stream having the inserted zero symbols.
- 15. (Original) A digital signal receiver as in claim 14, where the decoder comprises a Reed-Solomon decoder.
- 16. (Original) A digital signal receiver as in claim 14, where the decoder comprises a BCH decoder.
- 17. (Original) A digital signal receiver as in claim 14, where the decoder comprises a Turbo decoder.
- 18. (Original) A digital signal receiver as in claim 14, where said circuit inserts the zero symbols in conjunction with operation of a BPSK bit metric calculator.

Commissioner for Patents Application Serial No. 10/820,347 May 28, 2009 Page 6

- 19. (Original) A digital signal receiver as in claim 14, where said circuit inserts the zero symbols after a Viterbi decoder.
- 20. (Original) A digital signal receiver as in claim 14, further comprising a deinterleaver for de-interleaving the received symbol stream having the inserted zero symbols.
- 21. (Previously presented) A digital signal receiver as in claim 14, where said circuit comprises:

means for estimating a signal to noise ratio (SNR) of a block of L contiguous received symbols, where L is an integer greater than or equal to one; means for comparing the estimated SNR to a threshold SNR value; and means for replacing L symbols with L zero symbols when the estimated SNR is less than the threshold SNR.

- 22. (Original) A digital signal receiver as in claim 14, where said circuit comprises means for examining the output of at least one Automatic Gain Control (AGC) circuit.
- 23. (Original) A digital signal receiver as in claim 22, where said circuit comprises means for comparing the output of a slow AGC to a first threshold, means for

comparing the output of a fast AGC to a second threshold, and means for replacing

symbols with zero symbols when either the first or the second threshold is exceeded.

24. (Original) A digital signal receiver as in claim 22, where said circuit

comprises means for comparing a difference between the output of a slow AGC and the

output of a fast AGC to a threshold, and means for replacing symbols with zero symbols

when the difference exceeds the threshold.

25. (Original) A digital signal receiver as in claim 22, where said circuit

comprises means for comparing a difference between the output of a fast AGC and an

average of the output of the fast AGC to a threshold, and means for replacing symbols

with zero symbols when the difference exceeds the threshold.

26. (Original) A digital signal receiver as in claim 14, where said circuit uses

information received from a transmitter that is indicative of a time when a deep fade

occurs.

27. (Currently amended) A method to receive a signal that passes through a

channel that is periodically obstructed by a rotating propeller blade, comprising:

detecting the occurrence of a fading condition due to obstruction by the propeller

blade;

in response to detecting the occurrence of the fading condition,

Commissioner for Patents Application Serial No. 10/820,347

Page 8

determining which symbols comprising the signal have been degraded by the

fading condition;

inserting zero symbols into a received symbol stream at the receiver to replace

symbols that have been determined to have been degraded by the fading

condition caused by the obstructing propeller blade;

de-interleaving the received symbol stream having the inserted zero symbols; and

decoding the received symbol stream having the inserted zero symbols.

28. (Original) A method as in claim 27, where decoding comprises operating a

concatenated forward error correction (FEC) decoder.

29. (Original) A method as in claim 27, where decoding comprises operating

one of a Reed-Solomon decoder, a BCH decoder, or a Turbo decoder.

30. (Currently amended) A method to operate a satellite to receive a signal

that passes through a channel that is periodically obstructed by a rotating propeller blade,

comprising:

detecting, on the satellite, the occurrence of a fading condition due to obstruction

by the propeller blade;

in response to detecting the occurrence of the fading condition,

Commissioner for Patents Application Serial No. 10/820,347 May 28, 2009

Page 9

determining which symbols comprising the signal have been degraded by the

fading condition;

inserting zero symbols into a received symbol stream at the satellite to replace

symbols that have been determined to have been degraded by the fading

condition caused by the obstructing propeller blade;

de-interleaving the received symbol stream having the inserted zero symbols; and

error correction decoding the received symbol stream having the inserted zero

symbols.

31. (Currently amended) A satellite, comprising a receiver for receiving a

signal that passes through a channel that is periodically obstructed, the receiver

comprising circuitry for detecting the occurrence of a fading condition due to an

obstruction and, in response to detecting the occurrence of the fading condition,

determining which symbols comprising the signal have been degraded by the fading

condition, for inserting zero symbols into a received symbol stream to replace symbols

that have been determined to have been corrupted by the fading condition caused by the

periodic obstruction; and an error correction decoder for decoding the received symbol

stream having the inserted zero symbols.
